# Executive Summary

Infant mortality is an important indicator of community health. It is associated with a variety of factors such as economic development, general living conditions, social wellbeing where basic needs are met, rates of illness such as diabetes and hypertension, and quality of the environment. This report builds on information in the *Annual Summary of Vital Statistics, 2016* providing a long-term assessment of progress on infant mortality. The report uses five-year rolling average infant mortality to evaluate trends.

In the last century, the Kansas infant mortality rate (IMR) has decreased dramatically, from 73.5 deaths per 1,000 live births in 1912 (2,795 infant deaths) to 5.9 in 2016 (223).

- The Kansas IMR remained the same from 2015 (5.9 deaths per 1,000 live births) to 2016. The Kansas rate met the Healthy People 2020 (HP2020) objective of 6.0 deaths per 1,000 live births. The White non-Hispanic population IMR (5.2) and the Hispanic IMR (5.1) met the HP2020 target while the Black non-Hispanic (15.2) rate did not.
- The Black non-Hispanic infant mortality rate has remained more than twice that of the White non-Hispanic rate for most of the last 20 years.
- During 2012-2016, most Kansas resident infant deaths occurred soon after birth. Over two-thirds (68.2% or 819 deaths) happened in the neonatal time period (less than 28 days).
- During 2012-2016, the leading cause of infant mortality was congenital anomalies (22.4%), followed by prematurity or low birth weight (19.7%), sudden unexpected infant death (SUID) causes (18.1%), and maternal factors and complications (8.9%).
- Perinatal deaths include stillbirths and hebdomadal deaths (less than seven days). Complications of placenta, umbilical cord, and membrane was the leading cause of stillbirths; Prematurity or low birthweight was the leading cause for hebdomadal deaths.
- The 2012-2016 premature infant mortality rate of 43.0 per 1,000 live births was over 17 times higher than the rate for infants born at term (2.5). The IMR for very premature infants was 198.9 deaths per 1,000 live births, 80 times higher than infants born at term.

The *Selected Special Statistics, Stillbirths and Infant Deaths, Kansas, 2016* summarizes vital records data on stillbirths and infant deaths. This report can be found at <http://www.kdheks.gov/phi/index.htm>. Persons inquiring about additional data needs can call (785) 296-8627.

# Introduction

One of the basic indicators of the health of a community or state is infant mortality, the death of an infant before one year of age. The calculated infant mortality rate (IMR), serves as one proxy indicator of population health. It reflects the apparent association between the causes of infant mortality and other factors that are likely to influence the health status of the whole population such as economic development, general living conditions, social wellbeing where basic needs are met, rates of illness such as diabetes and hypertension, and quality of the environment [1].

Nationally, for 2015 the most recent year with final death data, statistics showed the infant mortality rate was 5.9 per 1,000 live births. The leading causes of infant death were congenital malformations; prematurity or low birthweight; sudden infant death syndrome (SIDS); and maternal factors and complications of pregnancy, labor and delivery [2].

The most recent national linked birth/infant death data set (2011-2013 data) included statistics on characteristics collected with the birth certificate in addition to the death certificate. Risk factors for infant death included Black non-Hispanic mothers, prematurity or low birthweight, multiple deliveries, unmarried mothers, mother's age (both younger and older mothers), and no prenatal care [3].

Healthy People 2020 (HP2020), which provides science-based, 10-year national objectives for improving the health of all Americans, includes infant mortality as a leading health indicator. The HP2020 target is 6.0 infant deaths per 1,000 live births [4].

The Kansas Department of Health and Environment's (KDHE) Bureau of Epidemiology and Public Health Informatics (BEPHI) monitors infant mortality and supports programs that promote access to health services for mothers and infants. The Bureau's Division of Public Health Informatics calculates the official state infant mortality rate as part of its ongoing mission to provide data and information to program managers, policy makers, health providers, and the public. This report augments information in the KDHE *Annual Summary of Vital Statistics, 2016* [5] and moves beyond single-year statistics in order to provide more long-term estimates of the true underlying rates.

## Methodology

### **Statistics**

Due to small numbers of events, preselected intervals of years are combined to increase data reliability. Five years (2012-2016) are combined for characteristic analysis, and intervals of 20 years and approximately 100 years are used for trend analysis. The long-term (~100 years) infant mortality numbers and rates may be under-reported due to incomplete data collection in the early 1900s.

Additionally, the relative standard error (RSE) is used in this report to evaluate reliability of rates. Values with a relative standard error of 30 percent or less are considered reliable. Values with a relative standard error greater than 30 percent but 50 percent or less

are considered unreliable, and rates with RSE greater than 50 percent have been suppressed in this document. This is consistent with standard National Center for Health Statistics (NCHS) practice [3, 6].

The following statistical tests have been applied where statistically significant differences have been noted in the document. When counts were  $\geq 100$ , a normal distribution was assumed and the z-test was used to compare two infant mortality rates [3]. When counts were  $< 100$ , a Poisson probability distribution was assumed and confidence intervals were calculated at the 95% confidence level to compare two infant mortality rates. If the confidence intervals of two values do not overlap it is considered a conservative estimate of a significant difference [10]. Caution should be used in interpreting these differences due to the relatively small number of occurrences and yearly fluctuations. Poisson Joinpoint regression models were used for trend analysis, and the annual percent change (APC) was used to characterize the trend over time [7, 8, 9]. Statistical significance is considered at the 0.05 level.

Five year rolling averages were used to smooth data trends over 20 years since year-to-year variation in infant mortality rates can result in a saw-tooth pattern that obscures underlying trends.

Stillbirths are also included in this report. Stillbirth statistics represent the first full year of events reported under new requirements. In Kansas, a stillbirth is defined as complete expulsion or extraction from its mother of a human child the gestational age of which is not less than 20 completed weeks, resulting in other than a live birth, and which is not an induced termination of pregnancy. [11]. The new definition has resulted in more events being reported. These events may have risk factors similar to those for infant deaths. Rates for 2014, 2015, and 2016 are not comparable to prior years.

All data reported are based on Kansas residence, unless otherwise noted.

### ***Age Period of Death***

The first year of life can be categorized by two major periods, the neonatal period (first 27 days of life) and the post-neonatal period (28 to 364 days of life). The infant deaths occurring in the neonatal period are also further sub-divided into the hebdomadal deaths (0-6 days) and post-hebdomadal deaths (7-27 days). Perinatal period III includes stillbirths and hebdomadal deaths.

### ***Cause of Death Data***

The cause of death referred to in this report is the primary or underlying cause of death. It is defined as the disease or injury which initiated the chain of events leading directly to death, or the circumstances of the accident or violence which produced the fatal injury. The underlying causes of death are established through a system known as the International Statistical Classification of Diseases and Related Health Problems, 10th Revision (ICD-10) [12]. This system promotes uniformity and comparability in the collection and presentation of mortality data.

In this document, Sudden Infant Death Syndrome (SIDS) deaths (ICD-10 code R95) are combined with accidental suffocation and strangulation in bed (ICD-10 code W75) and unknown cause (ICD-10 code R99) in some of the figures/tables. This combination is categorized as Sudden Unexpected Infant Death (SUID).

Analyzing SUID is important since the national campaign to reduce the risk of SIDS has entered a new phase and will now include all sleep-related SUIDs. SIDS, a major component of SUID, decreased by about 50 percent in the 1990s with the greatest decline occurring after the “Safe to Sleep” campaign was initiated in 1994 [13]. Since then, the decline in the SIDS rate has been less dramatic. The decline in SIDS is likely explained by increasing rates of infant deaths classified as “accidental suffocation and strangulation in bed” and “unknown cause”[3].

### ***Population Group Reporting***

This method creates a unique matrix of population groups combining race and Hispanic origin for reporting statistics. In the death certificate statistics (unlinked data) of this document, the population groups are classified using the race/ethnicity of the decedent as reported on the death certificate. The funeral director supplies this information, which is provided by an informant such as a family member.

In the linked birth/infant death statistics, the population groups are classified using the race/ethnicity reported on the birth certificate for the mother. For more information on the population groups, see the Technical Notes in the *Annual Summary of Vital Statistics, 2016* [5].

### ***Data Linkage***

This report also provides findings based on the linking of birth certificate and infant death certificate data. Where referenced, the linked birth/infant death statistics are based on a death cohort. The death cohort involves linkage of infant deaths with the corresponding live births. These births may have occurred in the same calendar year as the death or in the year prior.

The birth/infant death data analyzed are based on a union of single year linked birth/infant death files created six months after a given event year ended. Linkage of the respective records is performed by the BEPHI Public Health Informatics group using deterministic methodology based on the presence of a birth certificate identification number in the death history file. A manual matching process is used for infant deaths that do not match automatically. Because of the timeframe for creating the annual linked birth/infant death statistical files, infant death reports received later than six months after the end of a given event year are not included in the given event year.

Linked data are an important tool to examine infant mortality comparisons between Kansas and other states including the District of Columbia, or the United States. To obtain statistically reliable state-specific data stratified by race and ethnicity, it is necessary to combine years. The National Center for Health Statistics combines three years; the most recent report includes data from 2011-2013. Infant mortality rates were not calculated for states/District of Columbia when the number of events was less than 20 [3]. For this report, five years (2012-2016) of linked birth/infant deaths were combined to obtain statistically reliable data for stratification on characteristic variables.

For Kansas, between 2012 and 2016, there were 1,201 resident infant deaths reported to KDHE (Table A). Of those, 1,195 (99.5%) were linked to a birth certificate. Thirty of the birth records that were linked occurred in 2011. Unlinked records were due to a number of factors beyond the scope of this summary.

Table A. Linked Birth/Infant Deaths, Percent Linked, Kansas, 2012 - 2016

Year	Infant Deaths, Total	Infant Deaths, Linked File	
	Number	Number	%
2012	254	254	100.0
2013	248	244	98.4
2014	246	246	100.0
2015	230	230	100.0
2016	223	221	99.1
Totals	1201	1195	99.5

This method of linking the infant death and their birth records is valuable for exploring the various relationships of the infant deaths with factors surrounding birth and with mother's risk factors

- The death file contains age at death and underlying cause.
- The birth file contains birthweight, gestational age, and information on the mother such as age, marital status, educational level, and maternal risk factors such as tobacco use.

## Results

### Trend Analyses

In 2016, the Kansas infant mortality rate was 5.9 per 1,000 live births (223 infant deaths). This rate remained unchanged from 5.9 per 1,000 live births (230 infant deaths) in 2015 (Tables 1, 2).

In the last century, the IMR has decreased dramatically (92.0%) from 73.5 deaths per 1,000 live births in 1912 (2,795 infant deaths) (Figure 1). Stillbirths decreased 77.6 percent from 26.8 stillbirths per 1,000 (live births + stillbirths) in 1912 (1,047 stillbirths) to 6.0 (237 stillbirths) in 2015 (Figure 2). Incomplete reporting of live births, infant deaths, and stillbirths in the early 1900s may have resulted in slightly higher or lower estimated mortality rates for those years.

In the last twenty years, there has been some fluctuation in the IMR from a first low of 6.7 in 2003, then reaching a high of 7.9 in 2007, and an overall low of 5.9 in 2015 and 2016. According to the results of a Joinpoint Poisson regression model, the IMR remained stable at 0.5% per year [95% CI: -0.4, 1.4] during the period 1997-2007. However, the IMR has continued to significantly decrease by 2.7% per year [95% CI: -3.8, -1.6%] since 2007 (Figure 3).

### **Neonatal/Post-Neonatal Period Deaths**

Neonatal death rates showed a decreasing trend during the period from 1997 to 2016 with some fluctuation. Post-neonatal death rates showed a similar trend to the overall IMR trend. Post-neonatal death rates from 1997 to 2007 fluctuated greatly with no significant trend; however, a significant decreasing trend was present from 2007-2016 (Table 2). For neonatal death rates, rolling five year averages showed a slight decrease in most years from 4.6 in 1997-2001 to 4.2 in 2012-2016. For post-neonatal death rates, rolling

five year averages showed an overall decrease from 2.5 in 1997-2001 to a low of 2.0 in 2012-2016, with some fluctuation in the years between (Figure 6).

### ***Perinatal Period III Deaths***

In Kansas from 1997-2016, rolling five year averages showed a gradual increase in perinatal death rates, with some fluctuation, increasing from 8.7 deaths per 1,000 live births in 1997-2001 to 8.8 in 2012-2016. The increase in perinatal death rates are largely due to an increase in stillbirth rates since 2014 (Figure 7).

### ***Population Groups***

For Kansas in 2016, the White non-Hispanic population group had the highest number of infant deaths (139 infant deaths), while the Black non-Hispanic group had the highest rate (15.2 per 1,000 live births) (Table 3). The disparity in rates between White and Black non-Hispanic infant deaths was evident in all periods of death (Table B).

Table B. Stillbirth, Perinatal Period III\* and Infant Mortality Rates by Selected Population Groups, Kansas, 2016

	Total	White non-Hispanic	Black non-Hispanic	Hispanic any race
Infant deaths <sup>†</sup>	5.9	5.2	15.2	5.1
Neonatal deaths <sup>†</sup>	3.8	3.3	9.6	3.8
Post neonatal deaths <sup>†</sup>	2.1	1.9	5.6	1.3
Stillbirths <sup>‡</sup>	6.7	5.3	15.4	8.3
Perinatal period III <sup>‡</sup>	9.8	8.0	22.9	12.0

\* Perinatal period III includes stillbirths and hebdomadal deaths (deaths that occur prior to the 7<sup>th</sup> day of life)

<sup>†</sup>Rate per 1,000 live births

<sup>‡</sup>Rate per 1,000 (live births + stillbirths)

A population group comparison over 20 years based on five year moving averages (Figure 4) revealed that the Black non-Hispanic population has consistently had the highest infant mortality rates. The rate has fluctuated, reaching a high of 17.1 in 2003-2007 and a low of 12.8 in 2011-2015. In the same 20 years, the White non-Hispanic population showed a slight decreasing trend from 6.6 in 1997-2001 to 5.0 in 2012-2016. The IMR in the Hispanic population has fluctuated from 6.5 in 1997-2001 to 7.0 in 2012-2016. The Black non-Hispanic IMR has remained over twice that of the White non-Hispanic population, with an average ratio of 2.5.

## Five Year Characteristic Analysis (2012-2016)

### Death Certificate Statistics

#### ***Causes of Infant Death***

The Kansas infant mortality rate for the period 2012-2016 was 6.1 infant deaths per 1,000 live births. The leading cause of infant mortality was congenital anomalies (Figure A, Table 5). The most frequent congenital anomaly was congenital malformations of the circulatory system (25.3%, ICD-10 codes Q20-Q28), followed by chromosomal abnormalities (20.1%, ICD-10 codes Q90-Q99) and congenital malformations of the nervous system (19.7%, ICD-10 codes Q00-Q07). About 3 in 4 (77.0%, 207 deaths) of congenital anomaly deaths occurred in the neonatal period (under 28 days). The category “other causes” includes conditions such as spinal muscular atrophy, secondary pulmonary hypertension, hypertrophic cardiomyopathy, myocarditis, and disorders of the lungs.

Analysis of select population groups for the 2012-2016 cohort revealed the leading cause of infant death for Black non-Hispanic and Hispanic infants was prematurity or low birthweight. The leading cause of death among White non-Hispanic infants was congenital anomalies (Table C).

Analysis of rates by population group showed that Black non-Hispanic and Hispanic infants died at a significantly greater rate than White non-Hispanic infants where the cause of death was prematurity or low birthweight. Black non-Hispanic infants died at a significantly greater rate than White non-Hispanic and Hispanic infants where the cause of death was SUID. Black non-Hispanic infants died at a significantly greater rate than White non-Hispanic and Hispanic infants where the cause of death was maternal factors and complications. Among infants that died of congenital anomalies, the infant death rates were not significantly different among these three population groups (Table C).

Table C. Infant Deaths by Selected Population Groups and Leading Causes of Death, Kansas, 2012-2016

Population Group*	Number of Deaths	Percent	Rate <sup>†</sup>
<b>Black non-Hispanic (n=171)</b>			
1. Prematurity or Low Birthweight	49	28.7	3.8
2. SUID	30	17.5	2.3
3. Congenital Anomalies	21	12.3	1.6
4. Maternal Factors	20	11.7	1.5
<b>White non-Hispanic (n=697)</b>			
1. Congenital Anomalies	179	25.7	1.3
2. SUID	134	19.2	1.0
3. Prematurity or Low Birthweight	111	15.9	0.8
4. Maternal Factors	62	8.9	0.4
<b>Hispanic any-race (n=218)</b>			
1. Prematurity or Low Birthweight	53	24.3	1.7
2. Congenital Anomalies	46	21.1	1.5
3. SUID	30	13.8	1.0
4. Maternal Factors	15	6.9	0.5

\*Non-Hispanic population group includes unknown Hispanic origin

<sup>†</sup>Rate per 1,000 live births

### ***Neonatal/Post-Neonatal Period Deaths***

There were 819 neonatal deaths (4.2 per 1,000 live births, 68.2%) and 382 post-neonatal deaths (2.0 per 1,000 live births) in the 2012-2016 Kansas infant death cohort (Tables 1, 2). Prematurity or low birth weight was the leading cause of neonatal deaths (28.8%), while SUID was the leading cause of post-neonatal deaths (50.0%) (Table 5).

### ***Perinatal Period III Deaths***

For the Kansas 2012-2016 cohort, 1,732 infants died in the perinatal period (8.8 per 1,000 live births and stillbirths) comprising 1,061 stillbirths and 671 hebdomadal deaths (Table 1). The leading cause of stillbirths was complications of placenta, umbilical cord and membrane (30.2%, ICD-10 code P02) (Table 7) while prematurity or low birthweight was the leading cause of death for hebdomadal period deaths (34.9%) (Table 5).

### ***County Rates***

The counties with the highest number of infant deaths in the 2012-2016 cohort included Sedgwick (267 or 22.2%), Johnson (160 or 13.3%), Wyandotte (105 or 8.7%), and Shawnee (76 or 6.3%). These four counties accounted for half (50.6 percent) of all infant deaths (Table 4).

The counties with the highest reliable ( $RSE \leq 30\%$ ) infant mortality rates, included Labette (8.7 infant deaths per 1,000 live births), Reno (8.6), Ford (8.5), Franklin (8.2), and Harvey (8.0); while the counties with the lowest (reliable) non-zero rates were Johnson (4.3), Saline (4.3), Leavenworth (4.7), Crawford (4.8), and Douglas (5.2). Among peer groups, the infant death rates were not significantly different among Frontier, Rural, Densely-Settled Rural, Semi-Urban, or Urban populations (Table 4).

Since the number of deaths was too small for analysis in many counties, counties were combined into Public Health Regions (Figure 5). The region with the highest reliable ( $RSE \leq 30\%$ ) infant mortality rate was the Southwest Surveillance Region at 8.1 per 1,000 live births. The region with the lowest infant mortality rate was the Central Kansas Region at 4.9 per 1,000 live births (Figure 5).

### ***Zip Code Rates***

Several zip codes had enough deaths to allow analysis on the 2012-2016 cohort. The zip codes with the highest reliable ( $RSE \leq 30\%$ ) mortality rates included three zip codes located in Sedgwick County: 67218 (13.7 deaths per 1,000 live births), zip code 67042 (Butler County, 11.7), 67211 (11.7), 67207 (11.4), and zip code 66067 (Franklin County, 11.4). The zip-codes with the lowest reliable ( $RSE \leq 30\%$ ) rates were 66062 (Johnson County, 3.0), 67401 (Saline County, 4.6), 66441 (Geary County, 4.6), 67203 (Sedgwick, 5.1), 66061 (Johnson County, 5.2).

## **Linked Birth/Infant Death Statistics**

### ***Kansas Statistics***

In this section, a variety of maternal and infant characteristics are presented on the linked birth and infant death data file (linked file) from 2012 to 2016. The linked file differs slightly from the mortality file (infant deaths from death certificates in 2012 to 2016), with 6 infant deaths not linked to a birth record. The Kansas linked file for 2012-2016 contains 1,195 (99.5%) of the 1,201 infant deaths contained in the mortality file.

Population group of the infant's mother was known for 1,185 (99.2%) of the 1,195 linked records. The mother's race was reported as White non-Hispanic in 693 live births (58.5%), Black non-Hispanic in 171 live births (14.4%), Native American non-Hispanic in 7 live births (0.6%), Asian or Pacific Islander non-Hispanic in 23 live births (1.9%), Multi-racial non-Hispanic in 62 live births (5.2%), other race non-Hispanic in 10 live births (0.8%), and Hispanic (all races) in 217 live births (18.3%).

### ***Cause of Death***

The leading cause of death among the 1,195 infants in the 2012-2016 linked file was congenital anomalies (269 deaths, 22.5%). This was followed by prematurity or low birth-weight (237 deaths, 19.8%), SUID (ICD-10 codes R95, R99, and W75, with combined 213 deaths, 17.8%), and maternal factors (107 deaths, 9.0%) (Table 8).

Prematurity is an important factor in infant death, even though short gestation and low birthweight may not be the primary cause. Among the infant deaths with primary cause of death as congenital anomalies, slightly over half (52.8%) were born preterm – primarily late preterm (24.7%). Ninety-one percent of the infant deaths due to maternal factors were born prematurely, with 84.9 percent born very premature (Table 8). The cause of death categorized as maternal factors and complications of pregnancy, labor and delivery include complications such as premature rupture of the membrane, placental separation, chorioamnionitis, and incompetent cervix.

Among infants where the cause of death was classified as SUID, 74.5 percent were born early term or later (Table 8).

### ***Birthweight***

Of the 1,195 linked records, birthweight of the infant was known for 1,189 (99.5%). Two hundred seventy (22.7%) of the deaths occurred to infants with birthweights of less than 500 grams; 302 (25.4%) of the deaths occurred to infants with birthweights of 500 to 1,499 grams; 194 (16.3%) of deaths occurred to infants with birthweights of 1,500 to 2,499 grams; and 423 (35.6%) of deaths occurred to infants with birthweights of 2,500 grams or more (Table 9).

Among the infant deaths where birthweight was known, 766 infants (64.4%) were low birthweight (less than 2500 grams). In the same time period (2012-2016), only 7.2 percent of all live births had low birthweight (Table 9,10).

Analysis of birthweight by mother's population group reveals 67 (39.2%) of the deaths occurred to Black Non-Hispanic infants with birthweights of less than 500 grams. Two hundred sixty-seven (38.8%) deaths occurred to White Non-Hispanic and 72 (33.2%) Hispanic infants with birthweights 2,500 grams or more (Table 9).

### ***Gestational Age***

Gestational age was known for 1,187 (99.3%) of the 1,195 linked records. Five hundred sixty-nine of the infants (47.9%) were very premature (less than 32 weeks), 57 (4.8%) were moderately premature (32 to 33 weeks), 122 (10.3%) were late premature (34 to 36 weeks), 190 (16.0%) were early term (37 and 38 weeks), and 249 (21.0%) were born at term (Table 9).

Among the infant deaths where gestational age was known, 766 (64.4%) of the infant deaths were premature (less than 37 weeks gestation) (Table 9). In the same time period (2012-2016), 8.6% of all live births were premature (Table 10).

Analysis of gestational age by mother's population group reveals that among the Black non-Hispanic population in 2012 through 2016, 71.9 percent of the infant deaths were premature; 60.4 percent of the infant deaths to White non-Hispanic mothers were premature, and among the Hispanic population, 65.7 percent were premature (Table 9). In the same period (2012-2016), 12.8 percent of all live births among Black Non-Hispanic mothers were premature, 8.6 percent of all live births among White Non-Hispanic mothers were premature, and among the Hispanic population, 8.2 percent of all live births were premature (Table 10).

### ***Plurality***

Birth plurality (the total number of births resulting from a single pregnancy) was known for 1,193 of the linked deaths. Eighty-six percent (86.3%) of the infants were singletons at birth (1,029), 12.7 percent (152) were part of twin deliveries, and 1.0 percent (12) were triplet or above deliveries. Thirteen percent (13.7%, 164 deaths) of infant deaths in the linked file occurred among multiple births, whereas for all live births in the same time period (2012-2016) only 3.4 percent were part of a multiple birth delivery (Table 9, 10).

### ***Mother's Age Group***

Age-group of the mother was known for 1,192 (99.8%) of the infant deaths. The highest percentage of deaths occurred to infants born to women aged 25-29 (31.1%), followed by women aged 20-24 (28.7%), women aged 30-34 (19.7%), and women aged 35-39 (9.6%) (Table 9). The highest percent of all live births in the same time period was to mothers 25-29 years of age (32.9%), followed by 30-34 years of age (27.6%) and 20-24 years of age (22.2%) (Table 10).

### ***Mother's Education***

For mothers 25 years of age and older, the education level was known for 730 (61.1%) of the linked deaths. Mothers whose education level was high school or GED had the highest percentage of infant deaths (24.4%), followed by those with some college but no degree (21.9%), and those with a Bachelor's Degree (19.9%). Mothers who have a doctorate degree had the lowest percent (1.4%) of infant deaths (Table 9). When comparing to the distribution of deaths by mothers' education level for the live births in the same time period (2012-2016), there was a higher percentage of mothers with a Bachelor's Degree (29.9%) and a lower percentage of mothers with a high school degree or GED (16.0%) (Table 10).

### ***Marital Status***

Marital status at the time of pregnancy was known for 1,187 (99.3%) of the linked deaths (2012-2016). In almost half (49.9%) of the infant deaths, the mother was not married at the time of her pregnancy or delivery (Table 9). This is compared with 36.3 percent of live births (2012-2016) where the mother reported she was not married (Table 10).

### ***Prenatal Care***

The month prenatal care began was known for 1,143 (95.6%) of the linked infant deaths. Seventy-two percent (72.8%) of these linked infant deaths started prenatal care in the first trimester. Eighty percent (80.1%) of all live births in the same time period (2012-2016) started prenatal care in the first trimester. Five percent (5.7%) of linked infant deaths had no prenatal care (65 infant deaths); however, only 0.8 percent of births had no prenatal care, resulting in a mortality rate among infants with no prenatal care at 39.7 deaths per 1,000 live births. Infants starting prenatal care in the second trimester also had a statistically significantly higher IMR (6.9) than infants starting prenatal care in the first trimester (5.3) (Tables 9, 10).

### ***Adequacy of Prenatal Care Utilization (APNCU) Index***

The APNCU index was known for 1,123 (94.0%) linked records. Of these where APNCU index was known, almost half (59.7%) had Adequate Plus prenatal care, 26.7% had Adequate, 5.7% had Intermediate and 17.9% had Inadequate prenatal care. Inadequate prenatal care was more common for infants in the linked birth/infant death dataset (17.9%) than for live births generally (11.1%). Adequate or better prenatal care was less common for infants in the linked birth/infant death dataset (76.4%) than for live births generally (82.7%), but Adequate Plus prenatal care was much more common for infants in the linked birth/infant death dataset (49.7%) than for live births generally (30.4%) (Tables 9, 10).

### ***Smoking***

Smoking status was reported in all 1,195 of the linked infant deaths. Mothers reported smoking at some time during pregnancy in 21.1 percent of the infant deaths compared with 11.9 percent of all live births from 2012 to 2016 (Tables 9, 10).

### ***Pay Source***

Delivery payer was known for 1,173 of linked infant deaths. The highest percent of these births were paid for by Medicaid (44.5%), followed by private insurance (42.7%), and self-pay (7.8%) (Table 9). For all live births in the 2012-2016 cohort with payer indicated, only 32.4 percent were paid for by Medicaid, and 54.0 percent were paid for by private insurance (Table 10). The infant mortality rate was 8.3 per 1,000 live births paid by Medicaid and 6.7 per 1,000 live births self-paid, significantly higher than 4.8 per 1,000 live births paid by private insurance.

### ***National Statistics***

Nationally, final birth and death data allows for the creation of the linked birth/infant death data set for the United States. From the most recently published report on linked infant death/birth statistics (2013 period), the infant mortality rate for the United States was 6.0 per 1,000 live births, which compares to 6.3 for Kansas residents for the same year [3]. This report combines the years 2011-2013 for analysis of birth characteristics such as race and ethnicity. The national infant mortality rate was 6.0 per 1,000 live births for this three year period; White non-Hispanic infant mortality was 5.1, Black non-Hispanic infant mortality was 11.3, and Hispanic infant mortality was 5.1 [3]. The same methodology used for these national statistics was used for Kansas 2011-2013 and the results can be found in *Selected Special Statistics, Stillbirths and Infant Deaths, Kansas, 2013* [14].

## **Discussion**

### ***Kansas Statistics***

In a little over a century, the Kansas IMR has decreased dramatically, from 73.5 deaths per 1,000 live births in 1912 to 5.9 in 2016. In the last twenty years, the overall decreasing trend of the IMR was statistically significant even with the fluctuations in this time period.

The IMR in Kansas in 2016 is at a historic low of 5.9, and meets the Healthy People 2020 objective of 6.0 deaths per 1,000 live births. Data analysis by population groups showed the White non-Hispanic population (5.2 per 1,000 live births) and the Hispanic population (7.6) met the HP2020 target, but the Black non-Hispanic population (15.2) did not [4].

Overall, in Kansas 2012-2016, 22.4 percent of infant deaths were attributed to congenital anomalies, 19.7 percent were attributed to prematurity or low birthweight, and 18.1 percent were attributed to SUID (Figure A). Black non-Hispanics and Hispanics were at an increased risk of infant death from prematurity. Black non-Hispanics were at an increased risk of infant death from SUID and maternal factors compared to White non-Hispanics and Hispanics (Table C).

Most infant deaths in Kansas in 2012 to 2016 occurred soon after birth. Two-thirds happened in the neonatal time period (less than 28 days of age), and over half occurred in the first week (Table 5).

### ***Risk Factors***

Analysis of the linked file revealed that low birthweight or prematurity were primary risk factors for infant death even when the underlying or primary cause of death was not prematurity or low birthweight.

Gestational age-specific analysis (linked file) showed an infant mortality rate of 43.0 per 1,000 live births for infants born prematurely, over 17 times that for infants born at term (2.5 deaths per 1,000 live births). Similarly, the infant mortality rate for very premature infants (less than 32 weeks, 198.9 per 1,000 live births) was 80 times higher than the rate for infants born at term.

Additional notable risk factors for infant deaths (linked file) included no prenatal care (5.7% of linked deaths) or second trimester prenatal care (18.7%), multiple births (13.7%), mothers who smoked during pregnancy (20.6% of infant deaths), and out-of-wedlock births (49.5%).

### ***National Statistics***

Comparing Kansas, other states, and national statistics on infant mortality is complicated by the fact that national statistics are published much later than state statistics. The most recent available final national birth and death data are for 2015 [2, 15]. Final results indicate a national infant mortality rate of 5.9 per 1,000 live births, compared to 5.9 for Kansas residents in 2015. The difference between these two rates is not statistically significant.

The most recently published national report that analyzed linked infant mortality used 2011-2013 data. Nationally, the infant mortality rate was 6.0 per 1,000 live births for this period [3]. This report also presents the national and state infant mortality rates by race and Hispanic origin. The Kansas rates remain higher than the national rates for Black Non-Hispanic and Hispanic population subgroups [3].

## Limitations

This report's findings are subject to several limitations. An important concern is the issue of receiving vital events from other states within the KDHE reporting deadline. Vital statistics are gathered on an occurrence basis but are traditionally reported on a residence basis. For complete residence statistics, reports must be received from other states for events occurring to Kansas residents. Because of delays or other late reporting, some out-of-state vital event reports have not been received by KDHE by the cutoff date of June 30 of the year following the event year. Past evaluations indicate that over 99 percent of all vital events to Kansas residents are received before the cutoff date.

Evaluation of the linked birth/infant death cohort is subject to limitations due to the inability to link all deaths to a corresponding birth report. This inability may be due to a number of reasons related to receipt of the corresponding record from another state, name differences between the two reports, both events not occurring in Kansas, or residency changes.

Additionally, comparison of Kansas linked data to other state or national data has limitations due to the timeliness of the national reports as well as differences in methodology. As mentioned earlier, out-of-state births may not be available to match infant deaths at the state level, but are available for matching at the national level.

The ICD-10 death classification system limits the bias of human coding of mortality information. The system also attempts to reduce the effect of spelling errors or placement of literal information in the cause of death fields. One limitation is the system's inability to take into account differences in knowledge and attitudes among physicians who complete the cause of death information. Individual biases, unfamiliarity with the patient, or inability to perform an autopsy may affect the information available to the physician when certifying the cause of death. While many death certificates contain four full lines of detailed information on the events or illnesses leading up to the death, some death certificates contain only limited information.

The causes of stillbirths are not as well documented as those of infant deaths. The American Congress of Obstetricians and Gynecologists recommends an increase in the percentage of stillbirths for which placental evaluation is performed and autopsy is offered [16]. Additionally, since KSA 65-2401 [11] was revised in mid-2014 to change the stillbirth reporting requirements from weight of the fetus (>350 grams) to length of gestation ( $\geq 20$  weeks), vital records data for this year may not represent a consistent picture of all fetal deaths.

Smoking status and other potential risk factors may be under-reported on birth certificates.

## Technical Notes

Data for 2005 and years following are based on Kansas implementation of the 2003 revision of the U.S. Standard Certificates of Live Birth, Death, and Stillbirth. Data for prior years is based on the 1989 revision of the U.S. Standard Certificate of Live Birth, Death, and Stillbirth.

Data analysis involving the 2005 Kansas Certificate of Live Birth is affected in several ways:

- Changes in both question wording and sources for the information collected make it inappropriate to evaluate trends across 2004 and 2005 in some variables such as month prenatal care began and education level
- Calculating Month Prenatal Care Began – prior to 2005 – the mother was asked for the month prenatal care began. Starting in 2005, the dates used to calculate the month prenatal care began included the first day of the last menses before pregnancy and the date of the first prenatal visit. This change makes rates calculated after 2004 incompatible with earlier years. Such comparisons are inappropriate.
- KDHE publishes data on resident births and deaths. If the event occurs out of state and the state is not using the 2003 revision of the birth certificate, missing data may result. This is an important factor in border counties.
- KDHE excludes unknowns from the denominator for all calculations that result in percentage rates involving birth data. Other states may choose to include unknowns in the denominator. The Kansas method provides a more accurate representation of the rates.
- The 2003 revision process resulted in recommendations that the prenatal care information be gathered from the prenatal care or medical records, whereas the 1989 revision did not recommend a source for these data. In the case of premature births, sometimes these records aren't available when the infant is delivered.
- Infant mortality rates reported by NCHS may vary slightly from rates reported by KDHE. NCHS rates are based on data reported to it by all states. Some of those out-of-state occurrence infant deaths may not be reported to KDHE in time for inclusion in the respective year's *Annual Summary of Vital Statistics* or subsequent reports.
- Percentages may not add to 100 percent due to rounding.

Beginning in July 2014, requirements for reporting stillbirths or fetal deaths to the Kansas Department of Health and Environment changed. All stillbirths in which the unborn child is 20 weeks gestation and greater must now be reported. The old law required stillbirths to be reported when fetal weight was greater than 350 grams. The change may result in slightly different counts because of the different definitions of stillbirth and implementation occurring mid-year. The reporting certificate did not change.

### **Population Groups**

This report uses the concept of reporting race and Hispanic origin combined into distinct categories of population groups. This was done to preserve the self-reported information on race and origin reported in the expanded categories. The use of population groups assures a better uniformity of the numerators and denominators in rate calculations.

Because of different tabulation methods, totals for population groups may not equal those tabulated by either race or Hispanic origin individually. Rates calculated exclusively on Hispanic origin treat unknowns differently.

The aggregation grid for population groups is listed on page 172 of the *Annual Summary of Vital Statistics, 2014*. Application of this grid assures that every combination of race and origin is assigned to a population group. In instances where the Hispanic origin of an individual is unknown, the person is assigned to a population group solely on the basis of race and is considered non-Hispanic.

### **Peer Groups**

For various demographic studies, it is useful to consider groups of counties with similar characteristics. "Peer Groups" of counties, as used in this summary, are defined as those with similar population density based on a method derived by the KDHE Bureau of Community Health Systems. (See Appendix 1 for county tables indicating population density peer group membership before and after the 2010 U.S. Census.)

Frontier counties are defined as those with less than 6.0 persons per square mile, Rural counties as those with 6.0 - 19.9 persons per square mile, Densely-Settled Rural counties as those with 20.0 - 39.9 persons per square mile, Semi-Urban counties as those with 40.0 - 149.9 persons per square mile, and Urban counties as those with 150.0 or more persons per square mile. These designations should *not* be confused with the USCB definitions of urban and rural areas.

The KDHE Bureau of Epidemiology and Public Health Informatics applies these definitions, updating the groups with every decennial census. Based on the 2010 U.S. Census, eight Kansas counties changed peer groups. In order to facilitate a time series comparison, Peer-Group statistics for prior years are based on the Peer-Group in effect during that decade [2]. Sources for calculation of population densities are population figures from the 2010 U.S. Census and land areas from the 2010 U.S. Census.

# APPENDIX 1 Kansas County Codes and Groupings

Office of Vital Statistics

**CERTIFICATE OF STILLBIRTH (FETAL DEATH)**

**State File Number**

1. NAME (First, Middle, Last, Suffix)		2. DATE OF DELIVERY (Month, Day, Year)	3. TIME OF DELIVERY <div style="text-align: right;">M</div>
4. SEX	5. CITY, TOWN, OR LOCATION OF DELIVERY		6. COUNTY OF DELIVERY
7. PLACE OF DELIVERY <input type="checkbox"/> Hospital <input type="checkbox"/> Freestanding Birthing Center <input type="checkbox"/> Home Delivery <input type="checkbox"/> Clinic/Doctor's Office <input type="checkbox"/> Other (Specify) _____		8. FACILITY NAME (If not institution, give street and number and zip code)	
9. MOTHER'S CURRENT LEGAL NAME (First, Middle, Last, Suffix)			10. MOTHER'S LAST NAME PRIOR TO FIRST MARRIAGE
11. DATE OF BIRTH (Month, Day, Year)		12. BIRTHPLACE (State, Territory, or Foreign Country)	
13. PRESENT RESIDENCE-STATE			
14. COUNTY	15. CITY, TOWN, OR LOCATION	16. STREET AND NUMBER OF PRESENT RESIDENCE	
17. ZIPCODE	18. INSIDE CITY LIMITS? <input type="checkbox"/> Yes <input type="checkbox"/> No	19. MOTHER'S MAILING ADDRESS (If same as residence, leave blank)	
20. FATHER'S CURRENT LEGAL NAME (First, Middle, Last, Suffix)		21. DATE OF BIRTH (Month, Day, Year)	22. BIRTHPLACE (State, Territory, or Foreign Country)
23. I CERTIFY THAT THE PERSONAL INFORMATION PROVIDED ON THE CERTIFICATE IS CORRECT TO THE BEST OF MY KNOWLEDGE AND BELIEF.  Signature of Parent (or Other Informant) ➤			24. DATE SIGNED (Month, Day, Year)
<b>25. CAUSE/CONDITIONS CONTRIBUTING TO FETAL DEATH</b>			
25a. INITIATING CAUSE/CONDITION (Among the choices below, please select the <u>one</u> which most likely began the sequence of events resulting in the death of the fetus.)			
Maternal Conditions/Diseases (Specify) _____			
Complications of Placenta, Cord, or Membranes – <input type="checkbox"/> Rupture of membranes prior to onset of labor <input type="checkbox"/> Abruptio placenta <input type="checkbox"/> Placental insufficiency <input type="checkbox"/> Prolapsed cord			
<input type="checkbox"/> Chorioamnionitis <input type="checkbox"/> Other (Specify) _____			
Other Obstetrical or Pregnancy Complications (Specify) _____		Fetal Anomaly (Specify) _____	
Fetal Injury (Specify) _____		Fetal Infection (Specify) _____	
Other Fetal Conditions/Disorders (Specify) _____		<input type="checkbox"/> Unknown	
25b. OTHER SIGNIFICANT CAUSES OR CONDITIONS (Select or specify all other conditions contributing to death in item 25a.)			
Maternal Conditions/Diseases (Specify) _____			
Complications of Placenta, Cord, or Membranes – <input type="checkbox"/> Rupture of membranes prior to onset of labor <input type="checkbox"/> Abruptio placenta <input type="checkbox"/> Placental insufficiency <input type="checkbox"/> Prolapsed cord			
<input type="checkbox"/> Chorioamnionitis <input type="checkbox"/> Other (Specify) _____			
Other Obstetrical or Pregnancy Complications (Specify) _____		Fetal Anomaly (Specify) _____	
Fetal Injury (Specify) _____		Fetal Infection (Specify) _____	
Other Fetal Conditions/Disorders (Specify) _____		<input type="checkbox"/> Unknown	
26. ESTIMATED TIME OF FETAL DEATH <input type="checkbox"/> Dead at time of first assessment, no labor ongoing <input type="checkbox"/> Dead at time of first assessment, labor ongoing <input type="checkbox"/> Died during labor, after first assessment <input type="checkbox"/> Unknown time of fetal death		27a. WAS AN AUTOPSY PERFORMED? <input type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> Planned	27b. WAS A HISTOLOGICAL PLACENTAL EXAMINATION PERFORMED? <input type="checkbox"/> Yes <input type="checkbox"/> No <input type="checkbox"/> Planned
		27c. WERE AUTOPSY OR HISTOLOGICAL PLACENTAL EXAMINATION RESULTS USED IN DETERMINING THE CAUSE OF FETAL DEATH? <input type="checkbox"/> Yes <input type="checkbox"/> No	
28. I CERTIFY THAT THIS DELIVERY OCCURRED ON THE DATE STATED ABOVE AND THE FETUS WAS BORN DEAD.  Signature ➤		29. DATE SIGNED (Month, Day, Year)	
		30. ATTENDANT'S NAME AND TITLE (If delivery not attended by physician) Name (Type) _____ <input type="checkbox"/> CNM/CM <input type="checkbox"/> Other Midwife <input type="checkbox"/> Other (Specify) _____	
31. CERTIFIER'S NAME AND TITLE (Type)  <input type="checkbox"/> M.D. <input type="checkbox"/> D.O. <input type="checkbox"/> Other (Specify) _____		32. CERTIFIER'S MAILING ADDRESS (Street and Number or Rural Route, City or Town, State, Zip Code)	
		33a. METHOD OF DISPOSITION <input type="checkbox"/> Burial <input type="checkbox"/> Cremation <input type="checkbox"/> Donation <input type="checkbox"/> Hospital Disposition <input type="checkbox"/> Removal from State <input type="checkbox"/> Other (Specify) _____	
33b. PLACE OF DISPOSITION (Name of cemetery, crematory, or other place)		33c. LOCATION (City or Town, and State)	
34. FUNERAL DIRECTOR OR HOSPITAL ADMINISTRATOR  Signature ➤		35. FIRM OR HOSPITAL NAME AND ADDRESS	
		36. DATE FILED BY STATE REGISTRAR (Month, Day, Year)	

PRENATAL	LABOR-DELIVERY/STILLBORN FETUS
<p><b>59. NUTRITION OF MOTHER</b></p> <p>1. Height _____</p> <p>2. Prepregnancy Weight _____</p> <p>3. Weight at delivery _____</p> <p>4. Did mother get WIC food for herself? Yes _____ No _____ Unknown _____</p> <p><b>60. MEDICAL RISK FACTORS</b> (Check all that apply.)</p> <p>1. <input type="checkbox"/> Diabetes, prepregnancy</p> <p>2. <input type="checkbox"/> Diabetes, gestational</p> <p>3.
